

## PULL Service Architecture

SMS pull service is designed based on auto responding system. When anybody makes any query for getting update about particular information, it's routed via GSM/ Short code service.

### Process details:

1. User makes query from mobile.
2. Message comes to SMSC
3. From SMSC messages routed to Client Server.
4. SMS Server application receives the message
5. Take respective action on that.

Note: Message should be keyword based. Respective action will be taken based on keyword.

### Architecture of PULL Service :
